## LO: Represent data using a cumulative frequency graph

The marks for 24 pupils in a test were as follows:
$23,24,34,45,56,23,57,41,37,65,17,26$
$35,44,33,48,19,61,58,55,49,44,57,41$

Step 1: Put the data in order (this will usually be done for you in an exam).

## 1 2 3 <br> Key: <br> 4 <br> 5 <br> 6

Step 2: Put the data in a table with groups (this will usually be done for you in an exam).

| Mark (m) | Frequency |  |
| :---: | :---: | :---: |
| $10 \leq \mathrm{m}<20$ |  |  |
| $20 \leq \mathrm{m}<30$ |  |  |
| $30 \leq \mathrm{m}<40$ |  |  |
| $40 \leq \mathrm{m}<50$ |  |  |
| $50 \leq \mathrm{m}<60$ |  | $\uparrow$ |
| $60 \leq \mathrm{m}<70$ |  |  |

Step 3: Calculate the cumulative frequency (the running total).
As a check, the number in the final row should be the total number of pieces of data (in this case, 24).

[^0]Step 4: Plot the graph. Use the endpoint (last number) in the data column.

|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Step 5: Work out the median, lower quartile, upper quartile and inter-quartile range from the graph.

Median =
Lower quartile =
Upper quartile =
Inter-quartile range =
